**PREFACE**

This Service Manual describes the technical features and servicing procedures for the KYMCO *AGILITY 50*

Section 1 contains the precautions for all operations stated in this manual. Read them carefully before starting any operation.

Section 2 is the removal/installation procedures for the frame covers which are subject to higher removal/installation frequency during maintenance and servicing operations.

Section 3 describes the inspection/adjustment procedures, safety rules and service information for each part, starting from periodic maintenance.

Sections 6 through 17 give instructions for disassembly, assembly and inspection of engine, chassis frame and electrical equipment.

Most sections start with an assembly or system illustration and troubleshooting for the section. The subsequent pages give detailed procedures for the section.

1. GENERAL INFORMATION

SERVICE PRECAUTIONS

- Make sure to install new gaskets, O-rings, circlips, cotter pins, etc. when reassembling.

- When tightening bolts or nuts, begin with larger-diameter to smaller ones at several times, and tighten to the specified torque diagonally.

- Use genuine parts and lubricants.

- When servicing the motorcycle, be sure to use special tools for removal and installation.

- After disassembly, clean removed parts. Lubricate sliding surfaces with engine oil before reassembly.
1. GENERAL INFORMATION

- Apply or add designated greases and lubricants to the specified lubrication points.

- After reassembly, check all parts for proper tightening and operation.

- When two persons work together, pay attention to the mutual working safety.

- Disconnect the battery negative (-) terminal before operation.
- When using a spanner or other tools, make sure not to damage the motorcycle surface.

- After operation, check all connecting points, fasteners, and lines for proper connection and installation.
- When connecting the battery, the positive (+) terminal must be connected first.
- After connection, apply grease to the battery terminals.
- Terminal caps shall be installed securely.
1. GENERAL INFORMATION

- If the fuse is burned out, find the cause and repair it. Replace it with a new one according to the specified capacity.

- After operation, terminal caps shall be installed securely.

- When taking out the connector, the lock on the connector shall be released before operation.

- Hold the connector body when connecting or disconnecting it.
- Do not pull the connector wire.

- Check if any connector terminal is bending, protruding or loose.
1. GENERAL INFORMATION

- The connector shall be inserted completely.
- If the double connector has a lock, lock it at the correct position.
- Check if there is any loose wire.

- Before connecting a terminal, check for damaged terminal cover or loose negative terminal.

- Check the double connector cover for proper coverage and installation.

- Insert the terminal completely.
- Check the terminal cover for proper coverage.
- Do not make the terminal cover opening face up.

- Secure wire harnesses to the frame with their respective wire bands at the designated locations. Tighten the bands so that only the insulated surfaces contact the wire harnesses.
1. GENERAL INFORMATION

- After clamping, check each wire to make sure it is secure.

- Do not squeeze wires against the weld or its clamp

- After clamping, check each harness to make sure that it is not interfering with any moving or sliding parts.

- When fixing the wire harnesses, do not make it contact the parts which will generate high heat.

- Route wire harnesses to avoid sharp edges or corners. Avoid the projected ends of bolts and screws.
- Route wire harnesses passing through the side of bolts and screws. Avoid the projected ends of bolts and screws.

No Contact!
1. GENERAL INFORMATION

- Route harnesses so they are neither pulled tight nor have excessive slack.

- Protect wires and harnesses with electrical tape or tube if they contact a sharp edge or corner.

- When rubber protecting cover is used to protect the wire harnesses, it shall be installed securely.

- Do not break the sheath of wire.
  - If a wire or harness is with a broken sheath, repair by wrapping it with protective tape or replace it.

- When installing other parts, do not press or squeeze the wires.
1. GENERAL INFORMATION

- After routing, check that the wire harnesses are not twisted or kinked.

- Wire harnesses routed along with handlebar should not be pulled tight, have excessive slack or interfere with adjacent or surrounding parts in all steering positions.

- When a testing device is used, make sure to understand the operating methods thoroughly and operate according to the operating instructions.

- Be careful not to drop any parts.

- When rust is found on a terminal, remove the rust with sand paper or equivalent before connecting.

- Do not bend or twist control cables. Damaged control cables will not operate smoothly and may stick or bind.
1. GENERAL INFORMATION

Symbols:
The following symbols represent the servicing methods and cautions included in this service manual.

larımız
- **Engine Oil**: Apply engine oil to the specified points. (Use designated engine oil for lubrication.)
- **Grease**: Apply grease for lubrication.
- **Gear Oil**: Transmission Gear Oil (90#)
- **Special**: Use special tool.
- **Caution**: Caution
- **Warning**: Warning
- (⇒12-3): Refer to page 12-3.

1. GENERAL INFORMATION

FRAME

The following is the lubrication points for the frame.
Use general purpose grease for parts not listed.
Apply clean engine oil or grease to cables and movable parts not specified.
This will avoid abnormal noise and raise the durability of the motorcycle.

Symptom

- **Correct timing**
  - Correctly adjusted
  - No air leak
  - Good spark
  - Good

- **Incorrect timing**
  - Incorrectly adjusted
  - Air leaks
  - Weak or intermittent spark
  - Faulty

Probable Cause

- **Faulty CDI unit**
- **Faulty pulser coil**
- **Mixture too rich** (turn screw out)
- **Mixture too lean** (turn screw in)
- **Deteriorated O-ring**
- **Carburetor not securely tightened**
- **Damaged insulator rubber**
- **Broken vacuum tube**
- **Faulty or fouled spark plug**
- **Faulty CDI unit**
- **Faulty A.C. generator**
- **Faulty ignition coil**
- **Broken or shorted spark plug wire**
- **Faulty ignition switch**
- **Faulty air cut-off valve**
- **Damaged vacuum tube**
- **Clogged or damaged air vent hole**

NO SPARK AT SPARK PLUG

**Inspection/Adjustment**
- Replace with a new spark plug and inspect again

**Symptom**
- Weak or no spark
- Not loose
- Good
- Normal

**Probable Cause**
- Faulty old spark plug
- Loose spark plug cap
- Poorly connected coupler
- Faulty ignition switch
- Faulty pulser coil
- Faulty ignition coil
- Broken wire harness
- Poorly connected coupler
- Faulty CDI unit
- Faulty ignition coil

**Measure resistance between CDI unit coupler wire terminals**

**Check related parts**

**Check CDI unit with a CDI unit tester**

**Check ignition coil with a CDI unit tester**
SERVICE INFORMATION

GENERAL INSTRUCTIONS

• When removing frame covers, use special care not to pull them by force because the cover joint claws may be damaged.

Items Related for Removal

• Handlebar front cover ——— Handlebar rear cover
  Headlight wire connector

• Handlebar rear cover ——— Speedometer cable and instrument light wire connectors, etc.

• Frame body cover ——— Met-in box, rear grip, rear turn signal lights, floor board

• Floor board ——— Frame body cover
  Battery and wire connectors

• Front tool box ——— Front cover, floor board

TORQUE VALUES

Exhaust muffler joint lock nut 1.0~1.4kgf-m
Exhaust muffler lock bolt 3.0~3.6kgf-m
2. FRAME COVERS/EXHAUST MUFFLER

FRAME COVERS
FRONT COVER REMOVAL
Remove the screw on the front of the front cover.
Remove the six screws on the back of the front cover.
Remove the front cover.
The installation sequence is the reverse of removal.

HANDLEBAR FRONT/REAR COVER REMOVAL
HANDLEBAR FRONT COVER REMOVAL
Remove the handlebar front cover screw.
Remove the two screws attaching the handlebar front cover.
Disconnect the headlight wire connector and remove the handlebar front cover.

HANDLEBAR REAR COVER REMOVAL
Disconnect the speedometer cable, right and left handlebar switch couplers, and the stop switch wire connectors.
Remove the bolt attaching the handlebar rear cover.
Remove two screws inside the handlebar rear cover and remove the handlebar rear cover.
The installation sequence is the reverse of removal.
2. FRAME COVERS/EXHAUST MUFFLER

MET-IN BOX REMOVAL
Open the seat and remove the two nuts and three bolt attaching the met-in box.
Remove the met-in box.

FRAME BODY COVER REMOVAL
Remove the center cover.

Remove the three bolts attaching the rear carrier.
Remove the rear carrier.
Remove the four bolts on the rear seat.
Remove the rear seat.

Remove the six screws on the rear part of the frame body cover.
Remove the two screws on the front of the frame body cover.
2. FRAME COVERS/EXHAUST MUFFLER

Disconnect the seat lock wire.
Remove the frame body cover.
The installation sequence is the reverse of remove
Remove the three bolts attaching each of the right and left side covers.
Remove the right and left side covers.

* During removal, do not pull the joint claws forcedly to avoid damage.
When installing, be sure to connect the seat lock wire.

FLOOR BOARD REMOVAL
Remove the rear carrier and rear seat. (⇒2-3)
Remove the met-in box. (⇒2-3)
Remove the frame body cover. (⇒2-4)
Remove the eight bolts attaching the floor board.
Remove the floor board.

BOTTOM PROTECTOR COVER REMOVAL
Remove the sixbolts on the bottom protector cover.
Remove the bottom protector cover.
2. FRAME COVERS/EXHAUST MUFFLER

LEG SHIELD REMOVAL
Remove the bolt leg shield.
Remove the ignition switch decorative ring
Remove the leg shield.

FRONT FENDER REMOVAL
Remove the two bolts attaching the front fender bracket.
Remove the front fender.

EXHAUST MUFFLER REMOVAL
Remove the two exhaust muffler joint lock nuts.
Remove the two exhaust muffler lock bolts.
Remove the exhaust muffler.
Remove the exhaust muffler joint packing collar.

When installing, first install the exhaust muffler packing collar and then install the exhaust muffler.
First install and tighten the exhaust muffler joint lock nuts. Then, install and tighten the exhaust muffler lock bolts.

Torques:
Exhaust muffler lock bolt: 3.0~3.6kgf-m
Exhaust muffler joint lock nut: 1.0~1.4kgf-m

* Be sure to install a new exhaust muffler packing collar.
3. INSPECTION/ADJUSTMENT

SERVICE INFORMATION

GENERAL

⚠️ WARNING

• Before running the engine, make sure that the working area is well-ventilated. Never run the engine in a closed area. The exhaust contains poisonous carbon monoxide gas which may cause death to people.

• Gasoline is extremely flammable and is explosive under some conditions. The working area must be well-ventilated and do not smoke or allow flames or sparks near the working area or fuel storage area.

SPECIFICATIONS

ENGINE

Throttle grip free play : 2 ～ 6mm
Spark plug gap : 0.6 ～ 0.7mm
Spark plug : NGK C7HSA

Valve clearance : IN: 0.04mm
 : EX: 0.04mm

Idle speed : 1900 ±100rpm

Engine oil capacity:
At disassembly : 0.85 liter
At change : 0.7 liter

Gear oil capacity:
At disassembly : 0.11 liter
At change : 0.10 liter
3. INSPECTION/ADJUSTMENT

Cylinder compression : 16 kg/cm²
Ignition timing: BTDC 28°/4000rpm

CHASSIS
Front brake free play: 10 ~ 20mm
Rear brake free play: 10 ~ 20mm

*In the interest of safety, we recommend these items should be serviced only by an authorized KYMCO motorcycle dealer.*

Note: 1. For higher odometer readings, repeat at the frequency interval established here.
2. Service more frequently when riding in dusty or rainy areas.
3. Service more frequently when riding in rain or at full throttle.
3. INSPECTION/ADJUSTMENT

FUEL FILTER
Remove the met-in box. (⇒ 2-3)
Check the fuel lines and replace any parts which show signs of deterioration, damage or leakage.

* Do not smoke or allow flames or sparks in your working area.

THROTTLE OPERATION
Check the throttle grip for smooth movement. Measure the throttle grip free play.
Free Play: 2～6mm

Major adjustment of the throttle grip free play is made at the carburetor side.
Adjust by loosening the lock nut and turning the adjusting nut.

Minor adjustment is made with the adjusting nut at the throttle grip side.
Slide the rubber cover out and adjust by loosening the lock nut and turning the adjusting nut.
AIR CLEANER REPLACEMENT
Remove the air cleaner case cover screws and the cover by removing the seven screws.

Remove the air cleaner element by removing the four screws. Check the element and replace it if it is excessively dirty or damaged.

CHANGE INTERVAL
More frequent replacement is required when riding in unusually dusty or rainy areas.

* The air cleaner element has a viscous type paper element. Do not clean it with any fluid.
* Be sure to install the air cleaner element and cover securely.

SPARK PLUG
Remove the spark plug. Check the spark plug for wear and fouling deposits. Clean any fouling deposits with a spark plug cleaner or a wire brush.

Specified Spark Plug: CHAMPION-P-RZ9HC

Measure the spark plug gap.
Spark Plug Gap: 0.6 ~ 0.7mm

* When installing, first screw in the spark plug by hand and then tighten it with a spark plug wrench.
3. INSPECTION/ADJUSTMENT

VALVE CLEARANCE

* Inspect and adjust valve clearance while the engine is cold (below 35°C).

Remove the frame cover. (⇒2-3)
Remove the six bolts on the cylinder head cover.
Remove the cylinder head cover. (⇒7-3)
Remove the cylinder head cover.

Turn the flywheel counterclockwise so that the “T” mark on the flywheel aligns with the index mark on the crankcase to bring the round hole on the camshaft gear facing up to the top dead center on the compression stroke.

Inspect and adjust the valve clearance.
**Valve Clearance:** IN: 0.04mm
EX: 0.04mm

Loosen the lock nut and adjust by turning the adjusting nut.

**Special**

- Tappet Adjuster

* Check the valve clearance again after the lock nut is tightened.

CARBURETOR IDLE SPEED

* The engine must be warm for accurate idle speed inspection and adjustment.

Remove the inspection cover.
Warm up the engine before this operation.
Start the engine and connect a tachometer.
Turn the throttle stop screw to obtain the specified idle speed.
**Idle Speed:** 1900±100rpm

When the engine misses or run erratic, adjust the pilot screw.
3. INSPECTION/ADJUSTMENT

IGNITION TIMING

* The CDI unit is not adjustable. If the ignition timing is incorrect, check the ignition system. (⇒15-5)

Remove the right of the fan cover.

Check the ignition timing with a timing light. When the engine is running at idle speed, the ignition timing is correct if the “F” mark on the flywheel aligns with the index mark on the crankcase.

Also use a timing light to check the advance. Raise the engine speed to 4,000rpm and the index mark on the crankcase cover should be aligned with the advance mark on the flywheel.

CYLINDER COMPRESSION

Warm up the engine before compression test. Remove the met-in box and center cover. (⇒2-3)
Remove the spark plug.
Insert a compression gauge.
Open the throttle valve fully and push the starter button to test the compression.

Compression: 16kg/cm²rpm
If the compression is low, check for the following:
- Leaky valves
- Valve clearance to small
- Leaking cylinder head gasket
- Worn piston rings
- Worn piston/cylinder
If the compression is high, it indicates that carbon deposits have accumulated on the combustion chamber and the piston head.
3. INSPECTION/ADJUSTMENT

FINAL REDUCTION GEAR OIL
OIL LEVEL CHECK

* Place the motorcycle on its main stand on level ground for oil level check.

Stop the engine and remove the oil check bolt. The oil level shall be at the oil check bolt hole. If the oil level is low, add the recommended oil to the proper level.

Recommended Oil: SAE90#

Install the oil check bolt.

* Make sure that the sealing washer is in good condition.

OIL CHANGE

Remove the oil check bolt. Remove the oil drain bolt and drain the oil thoroughly. Install the oil drain bolt.

Torque: 0.8~1.2kgf-m

* Make sure that the sealing washer is in good condition.

Fill with the recommended oil.

Oil Capacity: At disassembly : 0.11 liter At change : 0.10 liter

Reinstall the oil check bolt and check for oil leaks.

Torque:0.8~1.2kgf-m

DRIVE BELT

Remove the left crankcase cover. (⇒9-2) Inspect the drive belt for cracks or excessive wear. Replace the drive belt with a new one if necessary and in accordance with the Maintenance Schedule.
3. INSPECTION/ADJUSTMENT

BRAKE SHOE
Replace the brake shoes if the arrow on the wear indicator plate aligns with the punch mark on the brake panel when the brake is fully applied. Refer to page 12-7 and 13-3 for brake shoe replacement.

REAR BRAKE
Measure the rear brake lever free play.
Free Play: 10 ~ 20mm

BRAKE ADJUSTING NUT
If the free play do not fall within the limit, adjust by turning the adjusting nut.

BRAKE FLUID
Turn the steering handlebar upright and check if the rear brake fluid level should be between the upper and lower level lines.
Specified Brake Fluid: DOT-4
If the free play do not fall within the limit, adjust by turning the adjusting nut.

HEADLIGHT AIM
Turn the ignition switch ON and start the engine.
Turn on the headlight switch.
Adjust the headlight aim by turning the headlight aim adjusting screw.

CLUTCH SHOE WEAR
Start the engine and check the clutch operation by increasing the engine speed gradually.
If the motorcycle tends to creep, or the engine stalls, check the clutch shoes for wear and replace if necessary. (⇒9-11)

SUSPENSION
FRONT
Fully apply the front brake lever and check the action of the front shock absorbers by compressing them several times.
Check the entire shock absorber assembly for oil leaks, looseness or damage.
3. INSPECTION/ADJUSTMENT

REAR
Check the action of the rear shock absorber by compressing it several times.
Check the entire shock absorber assembly for oil leaks, looseness or damage.
Jack the rear wheel off the ground and move the rear wheel sideways with force to see if the engine hanger bushings are worn.

NUTS/BOLTS/FASTENERS
Check all important chassis nuts and bolts for looseness.
Tighten them to their specified torque values if any looseness is found. (☞1-11)

WHEELS/TIRES
Check the tires for cuts, imbedded nails or other damages.

Check the tire pressure.

* Tire pressure should be checked when tires are cold.

</tr>
</tbody>
</table>

TIRE PRESSURE

TIRE SIZE
Front : 120/70-12
Rear : 130/70-12

Check the front axle nut for looseness.
Check the rear axle nut for looseness.
If the axle nuts are loose, tighten them to the specified torques.
Torques: Front : 5.0 ~ 7.0kgf-m
         Rear : 11 ~ 13kgf-m
STEERING HANDLEBAR
Check that the control cables do not interfere with handlebar rotation.
Raise the front wheel off the ground and check that the steering handlebar rotates freely.
If the handlebar moves unevenly, binds, or has vertical movement, adjust the steering head bearing.
4. LUBRICATION SYSTEM

SERVICE INFORMATION

GENERAL INSTRUCTIONS

- The maintenance of lubrication system can be performed with the engine installed in the frame.
- Use care when removing and installing the oil pump not to allow dust and foreign matters to enter the engine and oil line.
- Do not attempt to disassemble the oil pump. The oil pump must be replaced as a set when it reaches its service limit.
- After the oil pump is installed, check each part for oil leaks.

SPECIFICATIONS

</tr>
</tbody>
</table>

TROUBLESHOOTING

Oil level too low
- Natural oil consumption
- Oil leaks
- Worn or poorly installed piston rings
- Worn valve guide or seal

Poor lubrication pressure
- Oil level too low
- Clogged oil filter or oil passages
- Not use the specified oil
4. LUBRICATION SYSTEM

ENGINE OIL/OIL FILTER

OIL LEVEL

* • Place the motorcycle upright on level ground for engine oil level check.
  • Run the engine for 2～3 minutes and check the oil level after the engine is stopped for 2～3 minutes.

Remove the oil dipstick and check the oil level with the oil dipstick.
If the level is near the lower level, fill to the upper level with the specified engine oil.

OIL CHANGE

* The engine oil will drain more easily while the engine is warm.

Remove the drain bolt to drain the engine oil thoroughly.
Remove the oil filter screen cap and clean the oil filter screen with compressed air.

Check the filter screen O-ring for damage and replace if necessary.
Install the oil filter screen, spring and filter screen cap.
Torque: 1.0~2.0kgf-m

Fill the crankcase with the specified engine oil to the proper level.
Oil Capacity: At disassembly : 0.85 liter
  At change : 0.70 liter

Check for oil leaks and then start the engine and let it idle for few minutes.
Recheck the oil level.
OIL PUMP REMOVAL
Remove the A.C. generator flywheel. (⇒ 14-7)
Remove the A.C. generator stator and pulsar coil. (⇒ 14-6)
Remove the eight right crankcase cover bolts and the right crankcase cover.

Remove the gasket and dowel pins.
Remove the oil pump drive gear circlip.
Remove the oil pump gear.

Remove the oil pump mounting bolts.
Remove the oil pump.

Remove the two O-rings.
Inspect the two O-rings for damage or deterioration.
4. LUBRICATION SYSTEM

DISASSEMBLY
Remove the three oil pump boby screws. Disassemble the oil pump.

INSPECTION
Measure the pump boby-to-outer rotor clearance.
Service Limit: 0.12mm

Measure the inner rotor-to-outer rotor clearance.
Service Limit: 0.12mm

Measure the rotor end-to- pump boby clearance.
Service Limit: 0.2mm
4. LUBRICATION SYSTEM

ASSEMBLY
Install the outer rotor, inner rotor and pump shaft into the pump body.

* Install the pump shaft by aligning the flat on the shaft with the flat in the inner rotor.

Install the pump cover and tighten the screws to secure the pump cover.

INSTALLATION
First install the two O-rings onto the oil pump base.

Install the oil pump into the crankcase.

* Fill the oil pump with engine oil before installation.

After the oil pump is installed, tighten the three mounting bolts.
Install the pump driven gear and secure it with the circlip.

**Torque:** 0.8 ~ 1.2kg-m

Install the right crankcase cover and tighten the eight bolts.

**Torque:** 0.8~1.2kgf-m

*Diagonally tighten the bolts in 2 ~ 3 times.*

SERVICE INFORMATION

GENERAL INSTRUCTIONS

Gasoline is very dangerous. When working with gasoline, keep sparks and flames away from the working area.
Gasoline is extremely flammable and is explosive under certain conditions. Be sure to work in a well-ventilated area.

- When disassembling the carburetor, be sure to service the vacuum piston and float chamber.
- Do not bend or twist control cables. Damaged control cables will not operate smoothly.
- When disassembling fuel system parts, note the locations of O-rings. Replace them with new ones during assembly.
- Before float chamber disassembly, loosen the drain screw to drain the residual gasoline into a clean container.
- After the carburetor is removed, plug the intake manifold side with a clean shop towel to prevent foreign matters from entering.
- Remove the vacuum diaphragm before cleaning the carburetor air and fuel passages with compressed air to avoid damaging the vacuum diaphragm.
- When the motorcycle is not used for over one month, drain the residual gasoline from the float chamber to avoid erratic idling and clogged slow jet due to deteriorated fuel.

5. FUEL SYSTEM

TROUBLESHOOTING

Engine is hard to start
- No spark at plug (⇒ Section 15)
- Compression too low
- No fuel to carburetor
  - Clogged fuel filter
  - Restricted fuel line
  - Faulty float valve
  - Incorrectly adjusted float level
- Engine flooded with fuel
  - Clogged air cleaner
  - Fuel overflowing
- Intake air leak
- Contaminated fuel
- Faulty auto bystarter
- Clogged idle system or auto bystarter passages

Rich mixture
- Faulty auto bystarter
- Faulty float valve
- Float level too high
- Clogged air jets
- Dirty air cleaner
- Flooded carburetor

Lean mixture
- Clogged fuel jets
- Faulty float valve
- Float level too low
- Clogged fuel system
- Intake air leak
- Improper vacuum piston operation
- Improper throttle operation

Misfiring during acceleration
- Faulty ignition system
- Lean mixture
- Faulty accelerating pump

Engine idles roughly, stalls or runs poorly
- Clogged fuel system
- Ignition malfunction
- Rich or lean mixture
- Contaminated fuel
- Intake air leak
- Incorrect idle speed
- Incorrectly adjusted pilot screw
- Clogged idle system or auto bystarter passages
- Incorrectly adjusted float level

Backfiring at deceleration
- Lean mixture in idle system
- Improper air cut-off valve operation

−Clogged fuel filter
−Restricted fuel line
−Faulty float valve
−Incorrectly adjusted float level
5. FUEL SYSTEM

CARBURETOR REMOVAL

Remove the frame right side cover. (⇒ 2-4)
Disconnected the auto bystarter wire connector.
Remove the met-in box. (⇒ 2-3)

Loosen the drain screw and drain the fuel from the float chamber.
Disconnected the fuel tube and vacuum tube at the carburetor.

Loosen the throttle cable adjusting nut and lock nut, and disconnect the throttle cable from the carburetor.
Loosen the carburetor intake manifold band and air cleaner connecting tube band screws and then remove the carburetor.

AUTO BYSTARTER
OPERATION INSPECTION

Measure the resistance between the auto bystarter wire terminals.
Resistance: 10Ω max. (10 minutes minimum after stopping the engine)
If the reading is not within the limit, replace the auto bystarter with a new one.
Connect a hose to the fuel enriching circuit of the carburetor. Connect the auto bystarter yellow wire to the positive (+) terminal of a battery and green wire to the negative (-) terminal. Wait 5 minutes and blow the hose with mouth or vacuum pump. If the passage is blocked, the auto bystarter is normal.

Disconnect the auto bystarter from the battery. Wait 30 minutes and blow the hose with mouth or vacuum pump. If air can be blown into the hose, the auto bystarter is normal.

REMOVAL
Remove the set plate screws and set plate. Remove the auto bystarter from the carburetor.

AUTO BYSTARTER INSPECTION
Check the auto bystarter valve and needle for nicks, wear or damage. If any faulty part is found, replace the auto bystarter as a set.

INSTALLATION
Insert the auto bystarter into the carburetor body until it bottoms. Position the set plate into the groove in the auto bystarter and tighten the screws.

* Be sure to install the auto bystarter and set plate properly.
* Install the set plate with its bottom face facing down.
5. FUEL SYSTEM

AIR CUT-OFF VALVE
DISASSEMBLY
Remove the two screws attaching the throttle cable set plate and the set plate.
Remove the two screws attaching the air cut-off valve.
Remove the spring and vacuum diaphragm.
Check the vacuum diaphragm for cracks or damage and check each passage for clogging.

ASSEMBLY
Install the vacuum diaphragm onto the carburetor.
Install the spring and air cut-off valve cover.
Install the throttle cable set plate and tighten the two screws.

* Be sure to set the vacuum diaphragm lip into the groove on the carburetor.
* When installing the air cut-off valve cover, make sure that the vacuum diaphragm is properly installed.

VACUUM CHAMBER
DISASSEMBLY
Remove the two vacuum chamber cover screws and the cover.

Remove the spring and vacuum diaphragm/piston.
5. FUEL SYSTEM

ASSEMBLY
Install the vacuum piston/diaphragm in the carburetor body.
Install the spring and then install the vacuum chamber cover.
Tighten the two screws.

* • Be careful not to damage the diaphragm.
* • Hold the vacuum piston while tightening the vacuum chamber cover.

INSPECTION
Inspect the needle for stepped wear.
Inspect the vacuum piston for wear or damage.
Inspect the diaphragm for deterioration and tears.

* Be careful not to damage the vacuum diaphragm.
5. FUEL SYSTEM

FLOAT CHAMBER
DISASSEMBLY

Remove the three float chamber screws and the float chamber.

Loosen the float pin screw.
Remove the float pin, float and float valve.

Remove the main jet, needle jet holder, needle jet, slow jet and pilot screw.

* Be careful not to damage the fuel jets and pilot screw.
* Before removing, turn the pilot screw in and carefully count the number of turns until it seats lightly and then make a note of this.
* Do not force the pilot screw against its seat to avoid seat damage.

Clean the removed fuel jets with detergent oil and blow them open with compressed air.
Blow compressed air through all passages of the carburetor body.
5. FUEL SYSTEM

INSPECTION
Inspect the float valve and valve seat for damage or clogging.
Inspect the float valve and valve seat contact area for stepped wear or contamination.

* Worn or contaminated float valve and valve seat must be replaced because it will result in float level too high due to incomplete airtightness.

ASSEMBLY
Install the slow jet, needle jet, needle jet holder, main jet and pilot screw.

* Return the pilot screw to the original position as noted during removal.

Standard Opening: 2±1/2 turns

Install the float valve, float and float pin. Secure the float pin with the screw.

FLOAT LEVEL INSPECTION

* Check the operation of the float valve and float before this inspection.
* Measure the float level by placing the float level gauge on the float chamber face parallel with the main jet.

Measure the float level.

Float Level: 17.0mm

This installation sequence is the reverse of removal.
ACCELERATING PUMP
DISASSEMBLY
Remove the two accelerating pump cover screws and accelerating pump cover. Remove the spring and accelerating pump diaphragm.

INSPECTION
Inspect the accelerating pump diaphragm for cracks, damage or deterioration. Replace if necessary.

Check each accelerating pump fuel passage for clogging. Clean and blow them open with compressed air.

Install the accelerating pump in the reverse order of removal.

* Be careful not to damage the diaphragm during installation.
CARBURETOR INSTALLATION

Tighten the drain screw.
Install the carburetor onto the intake manifold, aligning the tab on the carburetor with the cutout in the intake manifold.
Tighten the intake manifold band screw.
Install the air cleaner connecting tube and tighten the band screw.
Connect the throttle cable to the throttle wheel on the carburetor.
Tighten the lock nut.

Connect the fuel tube and vacuum tube to the carburetor.

Connect the auto bystarter wire connector.
Perform the following inspections and adjustments:
- Throttle grip free play (⇒ 3-3)
- Carburetor idle speed (⇒ 3-5)
5. FUEL SYSTEM

PILOT SCREW ADJUSTMENT

* ADJUSTMENT

- The pilot screw is factory pre-set and no adjustment is necessary. During carburetor disassembly, note the number of turns of the pilot screw and use as a reference when reinstalling it.
- Place the motorcycle on its main stand on level ground for this operation.

A tachometer must be used when adjusting the engine speed. Turn the pilot screw clockwise until it seats lightly and back it out to the specification given.

**Standard Opening:** 2±1/2 turns

- The carburetor must be adjusted when the engine is warm and the auto bypasser is closed.
- Do not force the pilot screw against its seat to prevent damage.

Warm up the engine and adjust the throttle stop screw to obtain the specified idle speed.

**Idle Speed:** 1900±100rpm

Turn the pilot screw in or out slowly to obtain the highest engine speed. Slightly accelerate several times to make sure that the idle speed is within the specified range. If the engine misses or runs erratic, repeat the above steps.
**FUEL TANK REMOVE**
Remove the net-in box. (⇒2-3)
Remove the frame center cover.
Remove the frame body cover. (⇒2-3)
Remove the four bolts on the fuel tank, take the upper seat lock off.
Disconnect the fuel unit wire connector.
Remove the fuel tank.
The installation sequence is the reverse of removal.

**FUEL STRAINER REMOVAL**
Remove the fuel strainer from the fuel tank.

**INSPECTION**
Inspect if the fuel strainer is clogged and clean it with compressed air.

*When removing the fuel strainer, do not allow flames or sparks near the working area and drain the residual gasoline into a container.*

**INSTALLATION**
Install the fuel strainer with its arrow mark toward the fuel pump.
5. FUEL SYSTEM

FUEL UNIT

REMOVAL
Remove the related parts.
Disconnect the fuel unit wire connector.
Turn the fixed plate on the fuel unit, take the fuel unit off.

* Do not bend the float arm on the fuel unit, otherwise the figure on the fuel meter will not correct.

INSTALLATION
Inspect if the fuel unit is damaged, or harden.
Assemble the fuel unit in the reverse order of disassembly.

* Align the groove on the fuel unit with the angle on the fuel tank.
* Inspect if the fuel tank leaked after installing and filling the gasoline.

AIR CLEANER
Loosen the air cleaner connecting tube band screw.
Disconnect the clinhead cover breather tube from the air cleaner.
Remove the two bolts and air cleaner case.
The installation sequence is the reverse of removal.
SERVICE INFORMATION

GENERAL INSTRUCTIONS

• A floor jack or other adjustable support is required to support and maneuver the engine. Be careful not to damage the motorcycle body, cables and wires during engine removal.
• Use shop towels to protect the motorcycle body during engine removal.
• Parts requiring engine removal for servicing:
  — Crankcase
  — Crankshaft
ENGINE REMOVAL
 Disconnect the battery negative cable.
 Remove the frame body cover. (⇒ 2-3)
 Disconnect the spark plug high tension wire.
 Disconnect the auto bystarter wire connector.
 Disconnect the A.C. generator wire connector.

Disconnect the starter motor cable and earth cable from the starter motor.
 Remove the fuel tube.

Remove the spark plug cap.

Disconnect the vacuum tube.
 Loosen the throttle cable adjusting nut and lock nut, and disconnect the throttle cable from the carburetor.
Loosen the drive belt air cleaner connecting tube band screw and remove the connecting tube.

Remove the rear brake adjusting nut, connector pin rear brake cable.

Remove the rear shock absorber upper mount bolt.

Remove the engine mounting bolt and move the motorcycle forward to separate it from the engine. Support the motorcycle with a floor jack.
ENGINE HANGER BRACKET REMOVAL
Remove the return spring from the main stand.
Remove the main stand.

Remove the engine hanger bracket bolts and engine hanger bracket. Inspect the engine hanger bushings and stopper spring for wear or damage.

ENGINE HANGER BRACKET INSTALLATION
Install the engine hanger bracket to the chassis and tighten the bolt. Install the main stand onto the engine and install the return spring.

ENGINE INSTALLATION
Install the engine and tighten the engine mounting bolt.
**Torque:** 4.5~5.5kgf-m
Tighten the rear shock absorber upper mount bolt.
**Torque:** 4.5~5.5kgf-m
Install the removed parts in the reverse order of removal.

* Route the wires and cables properly.

After installation, inspect and adjust the following:
- Throttle grip free play (⇒ 3-3)
- Rear brake adjustment (⇒ 3-8)
SERVICE INFORMATION

GENERAL INSTRUCTIONS

- The cylinder head can be serviced with the engine installed in the frame.
- When assembling, apply molybdenum disulfide grease or engine oil to the valve guide movable parts, valve arm and camshaft sliding surfaces for initial lubrication.
- The camshaft is lubricated by engine oil through the cylinder head engine oil passages. Clean and unclog the oil passages before assembling the cylinder head.
- After disassembly, clean the removed parts and dry them with compressed air before inspection.
- After removal, mark and arrange the removed parts in order. When assembling, install them in the reverse order of removal.

7. CYLINDER HEAD/VALVES

TORQUE VALUES
Cylinder head nut 1.8~2.2kgf-m  Apply engine oil to threads
Valve clearance adjusting nut 0.7~1.1kgf-m  Apply engine oil to threads

SPECIAL TOOLS
Valve spring compressor

TROUBLESHOOTING
• The poor cylinder head operation can be diagnosed by a compression test or by tracing engine top-end noises.

Poor performance at idle speed
• Compression too low

Compression too low
• Incorrect valve clearance adjustment
• Burned or bent valves
• Incorrect valve timing
• Broken valve spring
• Poor value and seat contact
• Leaking cylinder head gasket
• Warped or cracked cylinder head
• Poorly installed spark plug

Compression too high
• Excessive carbon build-up in combustion chamber

White smoke from exhaust muffler
• Worn valve stem or valve guide
• Damaged valve stem seal

Abnormal noise
• Incorrect valve clearance adjustment
• Sticking valve or broken valve spring
• Damaged or worn camshaft
• Worn cam chain guide
• Worn camshaft and rocker arm
7. CYLINDER HEAD/VALVES

CAMSHAFT REMOVAL
Remove the center cover. (⇒2-3)
Remove the frame center.
Remove the four cylinder head cover bolts to remove the cylinder head cover.

Remove the cam chain tensioner sealing bolt and spring.
Remove the two bolts attaching the cam chain tensioner and the tensioner.

Turn the flywheel counterclockwise so that the “T” mark on the flywheel aligns with the index mark on the crankcase to bring the round hole on the camshaft gear facing up to the top dead center on the compression stroke.

Remove the two cylinder head bolts.
Remove the four cylinder head nuts and washers.
Remove the camshaft holder.

* Diagonally loosen the cylinder head nuts in 2 or 3 times.
Remove the camshaft holder and dowel pins.

Remove the camshaft gear from the cam chain and remove the camshaft.

**CAMSHAFT INSPECTION**

Check each cam lobe for wear or damage. Measure the cam lobe height.

**Service Limits:**

- IN: 26.038mm replace if below
- EX: 25.407mm replace if below

Check each camshaft bearing for play or damage. Replace the camshaft assembly with a new one if the bearings are noisy or have excessive play.
CAMSHAFT HOLDER DISASSEMBLY
Take out the valve rocker arm shafts using a 5mm bolt.
Remove the valve rocker arms.

CAMSHAFT HOLDER INSPECTION
Inspect the camshaft holder, valve rocker arms and rocker arm shafts for wear or damage.

* If the valve rocker arm contact surface is worn, check each cam lobe for wear or damage.

Measure the I.D. of each valve rocker arm.
**Service Limits:** IN: 10.10mm replace if over
**EX:** 10.10mm replace if over
Measure each rocker arm shaft O.D.
**Service Limits:** IN: 9.91mm replace if over
**EX:** 9.91mm replace if over

CYLINDER HEAD REMOVAL
Remove the camshaft. (⇒ 7-3)
Remove the carburetor. (⇒ 5-5)
Remove the exhaust muffler. (⇒ 2-5)
Remove the carburetor intake manifold.
7. CYLINDER HEAD/VALVES

Remove the cooling fan cover. (⇒ 14-6)
Remove the engine cover bolts and screws.
Separate the engine cover joint claws.

Remove the cylinder head.

Remove the dowel pins and cylinder head gasket.
Remove the cam chain guide.

Cylinder Head

Bolts

Dowel Pins

Cylinder Head Gasket

Cam Chain Guide
7. CYLINDER HEAD/VALVES

CYLINDER HEAD DISASSEMBLY
Remove the valve spring cotters, retainers, springs, spring seats and valve stem seals using a valve spring compressor.

* Be sure to compress the valve springs with a valve spring compressor.
* Mark all disassembled parts to ensure correct reassembly.

Valve Spring Compressor
Valve Spring Compressor Attachment

Remove carbon deposits from the combustion chamber.
Clean off any gasket material from the cylinder head mating surface.

* Be careful not to damage the cylinder head mating surface.

INSPECTION
CYLINDER HEAD
Check the spark plug hole and valve areas for cracks.
Check the cylinder head for warpage with a straight edge and feeler gauge.
Service Limit: 0.05mm repair or replace if over

VALVE SPRING FREE LENGTH
Measure the free length of the inner and outer valve springs.

Service Limits:
Inner : 30.1mm replace if below
Outer : 33.3mm replace if below
VALVE/VALVE GUIDE
Inspect each valve for bending, burning, scratches or abnormal stem wear.
Check valve movement in the guide.
Measure each valve stem O.D.
**Service Limits:**
IN: 4.9mm replace if below
EX: 4.9mm replace if below

CYLINDER HEAD ASSEMBLY

* When assembling, a valve spring compressor must be used.
* Install the cotters with the pointed ends facing down from the upper side of the cylinder head.

[Special]
Valve Spring Compressor
Valve Spring Compressor Attachment

Tap the valve stems gently with a plastic hammer for 2～3 times to firmly seat the cotters.

* Be careful not to damage the valves.

CYLINDER HEAD INSTALLATION
Install the dowel pins and a new cylinder head gasket.
Install the cam chain guide.
Install the cylinder head.

**CAMSHAFT HOLDER ASSEMBLY**
First assemble the camshaft holder.
Install the intake and exhaust valve rocker arms and rocker arm shafts.

* When installing the rocker arm shaft, align the shaft front end with the bolt hole of the camshaft holder.

**CAMSHAFT INSTALLATION**
Turn the flywheel so that the “T” mark on the flywheel aligns with the index mark on the crankcase.
Keep the round hole on the camshaft gear facing up and align the punch marks on the camshaft gear with the cylinder head surface (Position the intake and exhaust cam lobes down.) and install the camshaft onto the cylinder head.
Install the cam chain over the camshaft gear.

Install the dowel pins.
7. CYLINDER HEAD/VALVES

Install the camshaft holder, washers and nuts on the cylinder head.
Tighten the four cylinder head nuts and two bolts.

**Torque:** Cylinder head nut: 1.8~2.2kgf-m

* • Apply engine oil to the threads of the cylinder head nuts.
  • Diagonally tighten the cylinder head nuts in 2~3 times.

CAM CHAIN TENSIONER INSTALLATION

First install a new cam chain tensioner gasket.
Install the tensioner using the two bolts.
Install the tensioner spring.
Install the O-ring and sealing bolt.

* When installing the tensioner, release the lock pawl and push the push rod all the way in.

**Torque:** 0.45~0.6kgf-m

Adjust the valve clearance. (⇒3-5)
Install a new cylinder head cover O-ring and install the cylinder head cover.

* Be sure to install the O-ring into the groove properly.

Install and tighten the cylinder head cover bolts.
**Torque:** 0.8~1.2kgf-m
1.0kg-m

Do not bend
SERVICE INFORMATION

GENERAL INSTRUCTIONS

- The cylinder and piston can be serviced with the engine installed in the frame.
- After disassembly, clean the removed parts and dry them with compressed air before inspection.

</table>

TROUBLESHOOTING

- When hard starting or poor performance at low speed occurs, check the crankcase breather for white smoke. If white smoke is found, it means that the piston rings are worn, stuck or broken.

**Compression too low or uneven compression**

- Worn, stuck or broken piston rings
- Worn or damaged cylinder and piston

**Compression too high**

- Excessive carbon build-up in combustion chamber or on piston head
- Excessive smoke from exhaust muffler
- Worn or damaged piston rings
- Worn or damaged cylinder and piston
- Worn cylinder, piston and piston rings
- Worn piston pin hole and piston pin

Abnormal noisy piston

8-1
**CYLINDER REMOVAL**
Remove the cylinder head. (⇒ 7-6)
Remove the cam chain guide.
Remove the cylinder.

Remove the cylinder gasket and dowel pins. Clean any gasket material from the cylinder surface.

**PISTON REMOVAL**
Remove the piston pin clip.

* Place a clean shop towel in the crankcase to keep the piston pin clip from falling into the crankcase.

Press the piston pin out of the piston and remove the piston.
Inspect the piston, piston pin and piston rings. Remove the piston rings.

* Take care not to damage or break the piston rings during removal.

Clean carbon deposits from the piston ring grooves.

Install the piston rings onto the piston and measure the piston ring-to-groove clearance.

**Service Limits:**
- **Top:** 0.09mm replace if over
- **2nd:** 0.09mm replace if over

Remove the piston rings and insert each piston ring into the cylinder bottom.

* Use the piston head to push each piston ring into the cylinder.

Measure the piston ring end gap.

**Service Limit:** 0.45mm replace if over

Measure the piston pin hole I.D.

**Service Limit:** 13.04mm replace if below
Measure the piston pin O.D.

**Service Limit:** 12.96mm replace if below

Measure the piston O.D.

**Service Limit:** 38.9mm replace if below

Measure the piston-to-piston pin clearance.

**Service Limit:** 0.02mm replace if over

**CYLINDER INSPECTION**

Inspect the cylinder bore for wear or damage.

Measure the cylinder I.D. at three levels of top, middle and bottom at 90° to the piston pin (in both X and Y directions).

**Service Limit:** 39.10mm repair or replace if over

Measure the cylinder-to-piston clearance.

**Service Limit:** 0.1mm repair or replace if over

The true roundness is the difference between the values measured in X and Y directions. The cylindricity (difference between the values measured at the three levels) is subject to the maximum value calculated.

**Service Limits:**

**True Roundness:** 0.05mm repair or replace if over

**Cylindricity:** 0.05mm repair or replace if over
8. CYLINDER/PISTON

Inspect the top of the cylinder for warpage.
Service Limit: 0.05mm repair or replace if over

Measure the connecting rod small end I.D.
Service Limit: 13.06mm replace if over

PISTON RING INSTALLATION
Install the piston rings onto the piston.
Apply engine oil to each piston ring.

* Be careful not to damage or break the piston and piston rings.
* All rings should be installed with the markings facing up.
* After installing the rings, they should rotate freely without sticking.
8. CYLINDER/PISTON

PISTON INSTALLATION
Remove any gasket material from the crankcase surface.

* Be careful not to drop foreign matters into the crankcase.

Install the piston, piston pin and a new piston pin clip.

* Position the piston “IN” mark on the intake valve side.
* Place a clean shop towel in the crankcase to keep the piston pin clip from falling into the crankcase.

CYLINDER INSTALLATION
Install the dowel pins and a new cylinder gasket on the crankcase.

Coat the cylinder bore, piston and piston rings with clean engine oil. Carefully lower the cylinder over the piston by compressing the piston rings.

* Be careful not to damage or break the piston rings.
* Do not align the ring end gaps with the intake/exhaust valve and piston pin.
Install the cam chain guide.

* Insert the tab on the cam chain guide into the cylinder groove.

Install the cylinder head. (☞7-8)
Loosely install the cylinder base bolts.

Tighten the cylinder base bolts.
9. DRIVE AND DRIVEN PULLEYS/
KICK STARTER

AGILITY 50

5.0 ～ 6.0kg·m

3.5 ～ 4.5g·m

3.5 ～ 4.0g·m
SERVICE INFORMATION

GENERAL INSTRUCTIONS

- The drive pulley, clutch and driven pulley can be serviced with the engine installed.
- Avoid getting grease and oil on the drive belt and pulley faces. Remove any oil or grease from them to minimize the slipping of drive belt and drive pulley.

TORQUE VALUES

- Drive face nut 5.5~6.5kgf-m
- Clutch outer nut 3.5~4.5kgf-m
- Clutch drive plate nut 5.0-6.0kg-m

SPECIAL TOOLS

Universal holder
Clutch spring compressor

TROUBLESHOOTING

Engine starts but motorcycle won’t move
- Worn drive belt
- Broken ramp plate
- Worn or damaged clutch lining
- Broken driven face spring

Engine stalls or motorcycle creeps
- Broken clutch weight spring

Lack of power
- Worn drive belt
- Weak driven face spring
- Worn weight roller
- Fouled drive face
9. DRIVE AND DRIVEN PULLEYS/
KICK STARTER

LEFT CRANKCASE COVER
REMOVAL
Loosen the drive belt air tube band screw.
Remove the eight left crankcase cover bolts and left crankcase cover.
Remove the seal rubber and dowel pins.
Inspect the seal rubber for damage or deterioration.

* Use specified genuine parts for replacement.

KICK STARTER
REMOVAL
Remove the kick lever from the kick starter spindle.
Remove the circlip and washer from the kick starter spindle.

Gently turn the kick starter spindle to remove the starter driven gear together with the friction spring.

Remove the kick starter spindle and return spring from the left crankcase cover.
Remove the kick starter spindle bushings.
9. DRIVE AND DRIVEN PULLEYS/ KICK STARTER

INSPECTION
Inspect the kick starter spindle and gear for wear or damage.
Inspect the return spring for weakness or damage.
Inspect the kick starter spindle bushings for wear or damage.

Inspect the starter driven gear for wear or damage.
Inspect the friction spring for wear or damage.

Inspect the kick starter spindle and starter driven gear forcing parts for wear or damage.

INSTALLATION
Install the kick starter spindle bushings and return spring onto the left crankcase cover.
Install the starter driven gear and friction spring onto the left crankcase cover as the figure shown.

First install the washer and then install the circlip. Install the kick lever.

LEFT CRANKCASE COVER INSTALLATION
First install the dowel pins. Install the seal rubber.

Install the left crankcase cover and tighten the eight left crankcase cover bolts diagonally. Connect the drive belt air tube and tighten the tube band screw. Install the rear brake cable clamp.
9. DRIVE AND DRIVEN PULLEYS/KICK STARTER

DRIVE BELT

REMOVAL
Remove the left crankcase cover.

INSPECTION
Check the drive belt for cracks, separation or abnormal or excessive wear. Measure the drive belt width.  
**Service Limit:** 16.5mm

REPLACEMENT
Remove the eight left crankcase cover bolts and left crankcase cover.  
Hold the clutch outer with an universal holder and remove the clutch outer nut.  

[Special]
Universal Holder

Hold the drive pulley using a holder and remove the drive face nut, starting ratchet and washer.  
Remove the drive pulley face.

Remove the drive belt from the clutch/driven pulley.
9. DRIVE AND DRIVEN PULLEYS/ KICK STARTER

INSTALLATION
Turn the driven pulley clockwise to widen the drive belt groove and lay a new drive belt on the driven pulley.

Set the drive belt on the drive pulley face collar.
Install the drive pulley face, starting ratchet washer. Install and tighten the drive face nut.

* When installing, align the tooth space of the drive pulley face and starting ratchet with the crankshaft tooth and then tighten the nut.

DRIVE PULLEY REMOVAL
Hold the drive pulley using a holder and remove the drive face nut, starting ratchet and washer. Remove the drive pulley face.

DISASSEMBLY
Remove the movable drive face assembly and drive pulley collar from the crankshaft.
Remove the ramp plate.

Remove the weight rollers.

**INSPECTION**
Check each weight roller for wear or damage. Measure each weight roller O.D.
**Service Limit:** 12.4mm replace if below

Check the drive pulley collar for wear or damage. Measure the O.D. of the drive pulley collar sliding surface.
**Service Limit:** 19.97mm replace if below
9. DRIVE AND DRIVEN PULLEYS/ KICK STARTER

INSTALLATION
Install the drive pulley collar and movable drive face onto the crankshaft.

Set the drive belt on the drive pulley collar. Install the drive pulley face and tighten the drive face nut. (⇒9-6)
Torque: 5.5~6.5kgf-m

* Do not get oil or grease on the drive belt or pulley faces.

STARTER PINION

REMOVAL
Remove the left crankcase cover.
Remove the drive pulley.
Remove the starter pinion holder.
Remove the starter pinion.

INSPECTION
Inspect the starter pinion shaft forcing part for wear or damage.
Inspect the starter pinion for smooth operation.
Inspect the starter pinion and shaft for wear or damage.

INSTALLATION
Apply a small amount of grease to the starter pinion shaft and install it in the reverse order of removal.
9. DRIVE AND DRIVEN PULLEYS/
KICK STARTER

CLUTCH/DRIVEN PULLEY
REMOVAL
Remove the drive pulley. (⇒9-6)
Hold the clutch outer with the universal holder and remove the clutch outer nut.
Remove the clutch outer.

Universal Holder

Remove the clutch/driven pulley assembly
Remove the drive belt from the clutch/driven pulley assembly.

DISASSEMBLY
Hold the clutch/driven pulley assembly with the clutch spring compressor.
Set the clutch spring compressor in a vise and remove the 39mm clutch drive plate nut.
Loosen the clutch spring compressor and disassemble the driven pulley assembly.

Clutch Spring Compressor

Remove the seal collar.

Seal Collar
9. DRIVE AND DRIVEN PULLEYS/
KICK STARTER

Pull out the guide roller pins and guide rollers. Remove the movable driven face from the driven face. Remove the O-rings and oil seal from the movable driven face.

INSPECTION
Inspect the clutch outer for wear or damage. Measure the clutch outer I.D.
Service Limit: 107.5mm replace if over

Check the clutch shoes for wear or damage. Measure the clutch lining thickness.
Service Limit: 2.0mm replace if below

Measure the driven face spring free length.
Service Limit: 92.8mm replace if below
9. DRIVE AND DRIVEN PULLEYS/KICK STARTER

Check the driven face for wear or damage. Measure the driven face O.D.
**Service Limit:** 33.94mm replace if below
Check the movable driven face for wear or damage. Measure the movable driven face I.D.
**Service Limit:** 34.06mm replace if over

**DRIVEN PULLEY FACE BEARING REPLACEMENT**
Drive the inner needle bearing out of the driven pulley face.
Discard the removed bearing and replace with a new one.

Remove the snap ring and drive the outer bearing out of the driven face.

Apply grease to the outer bearing. Drive a new outer bearing into the driven face with the sealed end facing up. Seat the snap ring in its groove.

*Pack all bearing cavities with 5.0～5.6g grease.*
*Specified grease: Heat resistance 230°C*
9. DRIVE AND DRIVEN PULLEYS/KICK STARTER

Press a new needle bearing into the driven face.

ASSEMBLY
Install the movable driven face onto the driven face.
Install the O-rings, guide rollers and guide roller pins.
Install the new oil seal.

Install the seal collar.

Set the driven pulley assembly, driven face spring and clutch assembly onto the clutch spring compressor.
Compress the clutch spring compressor and install the 39mm drive plate nut.
Set the clutch spring compressor in a vise and tighten the drive plate nut to the specified torque.
Torque: 5.0 ~ 6.0kgf-m

Special
Clutch Spring Compressor
9. DRIVE AND DRIVEN PULLEYS/ KICK STARTER

INSTALLATION
Lay the drive belt on the driven pulley and install the clutch/driven pulley onto the drive shaft.

Install the clutch outer.
Hold the clutch outer with the universal holder.
Install and tighten the 10mm clutch outer nut.
**Torque**: 3.5~4.5kgf-m
Install the left crankcase cover. (⇒9-4)
SERVICE INFORMATION

SPECIFICATIONS
Specified Oil: GEAR OIL SAE 90#
Oil Capacity:  
At disassembly : 0.11 liter  
At change : 0.10 liter

SPECIAL TOOLS
Bearing puller, 10,12,15,18mm

TROUBLESHOOTING
Engine starts but motorcycle won't move
• Damaged transmission
• Seized or burnt transmission
• Faulty drive belt
• Faulty clutch

Abnormal noise
• Worn, seized or chipped gears
• Worn bearing

Oil leaks
• Oil level too high
• Worn or damaged oil seal
10. FINAL REDUCTION DISASSEMBLY

- Remove the rear brake cable. (⇒ 13-3)
- Remove the rear wheel. (⇒ 13-2)
- Remove the left crankcase cover. (⇒ 9-2)
- Remove the clutch/driven pulley. (⇒ 9-10)
- Drain the transmission gear oil into a clean container.
- Remove the transmission case cover attaching bolts.
- Remove the transmission case cover.
- Remove the gasket and dowel pins.

- Remove the final gear and countershaft.

10. FINAL REDUCTION INSPECTION

- Inspect the countershaft and gear for wear or damage.
- Inspect the final gear and final shaft for wear, damage or seizure.
Check the left crankcase bearings for excessive play and inspect the oil seal for wear or damage.

Inspect the drive shaft and gear for wear or damage. Check the transmission case cover bearings for excessive play and inspect the final shaft bearing oil seal for wear or damage.

* Do not remove the transmission case cover except for necessary part replacement. When replacing the drive shaft, also replace the bearing and oil seal.

**BEARING REPLACEMENT**
*(TRANSMISSION CASE COVER)*
Remove the transmission case cover bearings using a bearing puller. Remove the final shaft oil seal.

[Bearing Puller]

Drive new bearings into the transmission case cover.
10. FINAL REDUCTION

BEARING REPLACEMENT (LEFT CRANKCASE)
Remove the drive shaft.
Remove the drive shaft oil seal.
Remove the left crankcase bearings using a bearing puller.

Special
Bearing Puller

Drive new bearings into the left crankcase.
Install a new drive shaft oil seal.

FINAL REDUCTION ASSEMBLY
Install the drive shaft into the left crankcase.

Install the final gear and final shaft into the left crankcase.
Install the countershaft and gear into the left crankcase. Install the resin washer onto the countershaft. Install the dowel pins and a new gasket.

Install the transmission case cover.

Install and tighten the transmission case cover bolts. Install the clutch/driven pulley. (⇒9-13)

After installation, fill the transmission case with the specified oil. (⇒3-7)

**Specified Gear Oil**: SAE90#

**Oil Capacity**:
- At disassembly : 0.11 liter
- At change : 0.10 liter

Install and tighten the oil check bolt.

**Torque**: 0.8~1.2kgf-m

Start the engine and check for oil leaks. Check the oil level from the oil check bolt hole and add the specified oil to the proper level if the oil level is low.
11. CRANKCASE/CRANKSHAFT

SERVICE INFORMATION

GENERAL INSTRUCTIONS

• This section covers crankcase separation to service the crankshaft. The engine must be removed for this operation.
• The following parts must be removed before separating the crankcase.
  – Cylinder head (⇒ Section 7)
  – Cylinder/piston (⇒ Section 8)
  – Drive and driven pulleys (⇒ Section 9)
  – A.C. generator (⇒ Section 14)
  – Carburetor/air cleaner (⇒ Section 5)
  – Rear wheel/rear shock absorber (⇒ Section 13)
  – Starter motor (⇒ Section 16)
  – Oil pump (⇒ Section 4)

TORQUE VALUES

Crankcase bolt 0.8~1.2kgf-m
Cam chain tensioner slipper bolt 0.8~1.2kgf-m

TROUBLESHOOTING

Excessive engine noise
• Excessive bearing play
• Excessive crankpin bearing play
11. CRANKCASE/CRANKSHAFT

CRANKCASE SEPARATION
Remove the cam chain tensioner slipper bolt and cam chain tensioner slipper.

Remove the crankcase attaching bolt. Separate the left and right crankcase halves.

* • Do not damage the crankcase gasket surface.
• Never use a driver to pry the crankcase mating surfaces apart.

Remove the gasket and dowel pins.

Remove the crankshaft from the left crankcase. Remove the cam chain.
11. CRANKCASE/CRANKSHAFT

Clean off all gasket material from the crankcase mating surfaces.

* Avoid damaging the crankcase mating surfaces.

Remove the oil seal from the left crankcase.

Remove the oil seal from the right crankcase.

**CRANKSHAFT**

Measure the connecting rod big end side clearance.

*Service Limit:* 0.55mm replace if over
Measure the connecting rod big end radial clearance at two points at right angles to the shaft.

**Service Limit:** 0.05mm replace if over

Measure the crankshaft runout.

**Service Limit:** 0.10mm replace if over

Turn the crankshaft bearings and check for excessive play.
If they do not turn smoothly, quietly or if they fit loosely in the crankshaft, replace the crankshaft as a set.

**CRANKCASE ASSEMBLY**
Install new oil seals into the right and left crankcase.
Install the cam chain into the left crankcase. Install the crankshaft into the left crankcase.

* When installing the cam chain, be careful not to damage the oil seal.

Install the dowel pins and a new gasket onto the left crankcase.

* Place the right crankcase over the crankshaft and onto the left crankcase.

Tighten the crankcase attaching bolt.  
**Torque:** 0.8~1.2kgf-m
11. CRANKCASE/CRANKSHAFT

Install the cam chain tensioner slipper.
Install a new O-ring onto the cam chain
tensioner slipper bolt.
Apply engine oil to the O-ring and tighten the
bolt.
**Torque:** 0.8~1.2kgf-m

* Be sure to install the O-ring into the
groove.
SERVICE INFORMATION

GENERAL INSTRUCTIONS

- Remove the motorcycle frame covers before removing the front wheel. Jack the motorcycle front wheel off the ground and be careful to prevent the motorcycle from falling down.
- During servicing, keep oil or grease off the brake drum and brake linings.

TORQUE VALUES

- Handlebar bolt: 4.5–5.5kgf-m
- Steering stem lock nut: 6.0–8.0kgf-m
- Steering top cone race: 0.5–1.3kgf-m
- Front shock absorber bolt: 3.0kgf-m
- Front axle nut: 5.0–7.0kgf-m
- Brake arm bolt: 0.8–1.2kgf-m

SPECIAL TOOLS

- Long socket wrench, 32mm 8angle
12. FRONT WHEEL/FRONT BRAKE/FRONT SUSPENSION

TROUBLESHOOTING

Hard steering (heavy)
• Excessively tightened steering stem top cone race
• Broken steering balls
• Insufficient tire pressure

Steers to one side or does not track straight
• Uneven front shock absorbers
• Bent front fork
• Bent front axle or uneven tire

Poor brake performance
• Incorrectly adjusted brake
• Worn brake linings
• Contaminated brake lining surface
• Worn brake shoes at cam contacting area
• Worn brake drum
• Poorly connected brake arm

Front wheel wobbling
• Bent rim
• Excessive wheel bearing play
• Bent spoke plate
• Faulty tire
• Improperly tightened axle nut

Soft front shock absorber
• Weak shock springs
• Insufficient damper oil

Front shock absorber noise
• Slider bending
• Loose fork fasteners
• Lack of lubrication
STEERING HANDLEBAR

REMOVAL
Remove the handlebar front and rear covers.
(⇔2-2)
Remove the two bolts attaching each of the front and rear brake levers.
Remove the front and rear brake levers.

Remove the two throttle holder screws and throttle holder.
Disconnect the throttle cable from the throttle pipe and then remove the throttle pipe from the handlebar.

Remove the handlebar lock nut and bolt to remove the handlebar.

INSTALLATION
Install the handlebar onto the steering stem by aligning the tab on the handlebar with the bolt orifice on the steering stem.
Install and tighten the handlebar bolt and lock nut.
Torque: 4.5～5.5kgf-m
Apply grease to the tip of the throttle pipe. Install the throttle pipe and connect the throttle cable.

Install the front and rear brake levers in the reverse order of removal.

**FRONT WHEEL REMOVAL**
Jack the motorcycle front wheel off the ground.
Remove the speedometer cable set screw and disconnect the speedometer cable.
Remove the front brake cable.
Remove the front axle nut and pull out the axle.
Remove the front wheel.
Remove the front brake panel and side collar.

**INSPECTION**
**AXLE RUNOUT**
Set the axle in V blocks and measure the runout using a dial gauge.
The actual runout is $\frac{1}{2}$ of the total indicator reading.
**Service Limit:** 0.2mm replace if over
12. FRONT WHEEL/Front Brake/Front Suspension

WHEEL RIM
Check the wheel rim runout.
Service Limits:
Radial: 2.0mm replace if over
Axial: 2.0mm replace if over

Turn the wheel bearings and replace the bearings if they are noisy or have excessive play.

DISASSEMBLY
Remove the dust seal.
Remove the front wheel bearings and distance collar.

Special
Bearing Puller

ASSEMBLY

Pack all bearing cavities with grease.
Drive in the left bearing.
Install the distance collar.
Drive in the right bearing.

* Drive in the bearing squarely with the sealed end facing out.
Apply grease to a new dust seal lip and install the dust seal. Install the side collar.

**INSTALLATION**

Install the front wheel by aligning the brake panel groove with the front fork tab. Insert the axle shaft and tighten the axle nut.

**Torque:** 4.5kg-m

Connect the speedometer cable and secure it with the screw. Install the front brake cable and adjust the front brake lever free play.

**FRONT BRAKE**

Remove the front wheel. (☞12-4) Remove the front brake panel.

**INSPECTION**

Measure the brake drum I.D.

**Service Limit:** 111mm replace if over

* Measure each brake lining thickness.

**Service Limit:** 2.00mmmm replace if below

Keep oil or grease off the brake linings.
12. FRONT WHEEL/FRONT BRAKE/FRONT SUSPENSION

DISASSEMBLY
Do not swing the brake arm to expand the brake shoes.
Remove the brake shoes by removing the brake shoe springs using a screw driver.
Remove the brake arm and return spring.
Remove the wear indicator plate and felt seal.
Remove the brake cam.
Remove the dust seal and speedometer drive gear.

ASSEMBLY
Apply grease to the speedometer drive gear and then install it into the brake panel.
Apply grease to the dust seal lip and install it into the brake panel.

Apply grease to the anchor pin and brake cam.
Install the brake cam.
Install the return spring by aligning the spring hook end with the hole in the brake panel. Apply a small amount of engine oil to the felt seal and install it to the brake panel. Install the wear indicator plate on the brake cam by aligning the tooth on the plate with the groove on the brake cam.

Install the brake arm on the brake cam by aligning the punch mark on the brake arm and the scribed line on the brake cam. Install and tighten the brake arm bolt. **Torque**: 0.8~1.2kgf-m

Install the brake shoe springs to the brake shoes and then install the brake shoes into the brake panel.

**INSTALLATION**
Install the brake panel onto the front wheel. Install the front wheel. (☞12-7) Adjust the front brake lever free play.
HYDRAULIC BRAKE (FRONT BRAKE)
Brake Fluid Replacement/Air Bleeding
Check the brake fluid level on level ground.

*• When operating the brake lever, the brake reservoir cap must be tightened securely to avoid spill of brake fluid.
• When servicing the brake system, use shop towels to cover plastic parts and coated surfaces to avoid damage caused by spill of brake fluid.

Brake Fluid Bleeding
In order to avoid spill of brake fluid, connect a transparent hose to the bleed valve.

Warning
Brake fluid spilled on brake pads or brake disk will reduce the braking effect. Clean the brake pads and brake disk with a high quality brake degreaser.

Fully apply the brake lever and then loosen the brake caliper bleed valve to drain the brake fluid until there is no air bubbles in the brake fluid. Then, tighten the bleed valve. Repeat these steps until the brake system is free of air.

Brake Fluid Refilling
Add DOT-4 brake fluid to the brake reservoir.

*• When bleeding, be careful not to allow air in the brake reservoir flowing into the brake system.
• When using a brake bleeder, follow the manufacturer’s instructions.
• Never use dirty or unspecified brake fluid or mix different brake fluids because it will damage the brake system.

Make sure to bleed air from the brake system.
Brake Pad/Disk Replacement

* The brake pads must be replaced as a set to ensure the balance of the brake disk.

Remove the two bolts attaching the brake caliper.
Remove the brake caliper.
Remove the brake pad pins to remove the brake pads.

Install the brake pads in the reverse order of removal.
Tighten the brake pad pin bolts.
Torque: 1.5～2.0kgf-m

* • Keep grease or oil off the brake pads to avoid brake failure.
  • Do not reuse the brake pad pin bolts that have been removed.

Brake Disk
Measure the brake disk thickness.
Service Limit: 3.0mm
Measure the brake disk runout.
Service Limit: 0.3mm
12. FRONT WHEEL/FRONT BRAKE/FRONT SUSPENSION

BRAKE MASTER CYLINDER

Removal
First drain the brake fluid from the hydraulic brake system.

* • When servicing the brake system, use shop towels to cover rubber and plastic parts and coated surfaces to avoid being contaminated by brake fluid.
• When removing the brake fluid pipe bolt, be sure to plug the pipe to avoid brake fluid leak.

Disassembly
Remove the piston rubber cover and snap ring from the brake master cylinder.

Remove the washer, main piston and spring from the brake master cylinder. Clean the inside of the master cylinder and brake reservoir with brake fluid.
**Inspection**

Measure the brake master cylinder I.D.

**Service Limit:** 12.75mm

Inspect the master cylinder for scratch or crack.

---

Measure the brake master cylinder piston O.D.

**Service Limit:** 12.6mm

Before assembly, inspect the 1st and 2nd rubber cups for wear.

---

**Assembly**

Before assembly, apply brake fluid to all removed parts.

Install the spring together with the 1st rubber cup.

* 

- During assembly, the main piston and spring must be installed as a unit without exchange.
- When assembling the piston, soak the cups in brake fluid for a while.
- Install the cups with the cup lips facing the correct direction.

Install the main piston, spring and snap ring.

Install the rubber cover.

Install the brake lever.
Disassembly
Remove the brake caliper seat from the brake caliper.

Remove the piston from the brake caliper. If necessary, use compressed air to squeeze out the piston through the brake fluid inlet opening and place a shop towel under the caliper to avoid contamination caused by the removed piston. Check the piston cylinder for scratch or wear and replace if necessary.

Push the piston oil seal outward to remove it. Clean the oil seal groove with brake fluid.

* Be careful not to damage the piston surface.
12. FRONT WHEEL/FRONT BRAKE/FRONT SUSPENSION

Place the brake master cylinder on the handlebar and install the holder with “up” mark facing up. Be sure to align the punch mark with the holder joint.
First tighten the upper bolt and then tighten the lower bolt.
**Torque:** 3.0～4.0kgf-m

Install the brake fluid pipe with the attaching bolt and two sealing washers.

Install the handlebar covers. (☞12-3)
Fill the brake reservoir with recommended brake fluid to the upper limit and bleed air according to the method stated in 12-10.

**BRAKE CALIPER (FRONT)**

**Removal**
Remove the brake caliper.
Place a clean container under the brake caliper and disconnect the brake fluid pipe from the caliper.

*Do not spill brake fluid on any coated surfaces.*
Check the piston for scratch or wear. Measure the piston O.D. with a micrometer. **Service Limit:** 26.3mm

Check the caliper cylinder for scratch or wear and measure the cylinder bore. **Service Limit:** 26.45mm

**Assembly**
Clean all removed parts. Apply silicon grease to the piston and oil seal. Lubricate the brake caliper cylinder inside wall with brake fluid. Install the brake caliper piston with grooved side facing out.

*Install the piston with its outer end 3～5mm protruding beyond the brake caliper.*

Wipe off excessive brake fluid with a clean shop towel. Apply silicon grease to the brake caliper seat pin and caliper inside. Install the brake caliper seat.
**Installation**

Install the brake caliper and tighten the two bolts.

**Torque:** 2.9~3.5kg-m

Connect the brake fluid pipe to the brake caliper and tighten the fluid pipe bolt.

**Torque:** 2.5~3.5kg-m

Fill the brake reservoir with recommended brake fluid and bleed air from the brake system. (☞12-10)
FRONT SHOCK ABSORBER

REMOVAL
Remove the front wheel. (⇒ 12-4)
Remove the front lower cover. (⇒ 2-2)
Remove the front inner fender.
Remove the front shock absorber upper mount bolts.
Loosen the lower mount bolts to remove the front shock absorbers.

DISASSEMBLY
Remove the dust boot.
Remove the circlip.

Set the front shock absorber in a vise.
Remove the damper rod, hex bolt and copper washer.
Pull out the front shock absorber tube.

Set the front shock absorber tube in a vise.
Remove the top nut, shock spring, damper, and damper spring from the front shock absorber tube.

* When holding the shock absorber tube, place a shop towel to protect it and do not apply too much force.
Measure the front shock absorber spring free length.

**Service Limits:**
- Right: 206.4mm
- Left: 206.4mm

**ASSEMBLY**
Install the damper spring onto the damper rod and then install them into the front shock absorber tube. Install the shock absorber spring onto the front shock absorber tube and tighten the top nut.

* Install the front shock absorber spring with the closely wound coils facing down.

Set the front shock absorber in a vise. Insert the shock absorber tube into the shock absorber and tighten the hex bolt. (Apply locking agent to the washer and install it together with the hex bolt.)

**Torque:** 3.0kgf-m

Add engine oil into the front shock absorber.

**Specified Oil:** SS#8

**Oil Capacity:** 38±1cc

Install the circlip. Install the dust boot.

**INSTALLATION**

Install the front shock absorbers onto the steering stem. Install and tighten the front shock absorber upper mount bolts. Tighten the lower mount bolts.

* Align the upper mount bolt hole with the groove on the front fork.

Install the front wheel. (⇒12-7)
12. FRONT WHEEL/Front Brake/ Front Suspension

FRONT FORK

REMOVAL
Remove the steering handlebar. (⇒12-3)
Remove the front wheel. (⇒12-4)
Disconnect the speedometer cable.
Remove the steering stem lock nut using long
socket wrench.

[Special]
Long Socket Wrench, 32mm  8Angle

Remove the top cone race and remove the
steering stem.

* Be careful not to lose the steel balls (26
on top race and 29 on bottom race).

Inspect the ball races and cone races for wear
or damage and replace if necessary.

BOTTOM CONE RACE REPLACEMENT
Remove the bottom cone race using a chisel.

* Be careful not to damage the steering
stem and front fork.

Drive a new bottom cone race into place with
a proper driver.

BALL RACE REPLACEMENT
Drive out the top and bottom ball races.
12. FRONT WHEEL/Front Brake/ Front Suspension

Drive new top and bottom ball races into the steering head using the outer driver.

Be sure to completely drive in the ball races.

INSTALLATION

Apply grease to the top and bottom ball races and install 26 steel balls on the top ball race and 29 steel balls on the bottom ball race. Apply grease to the ball races and install the front fork.

Apply grease to the top cone race and install it. Tighten the top cone race and then turn the steering stem right and left several times to make steel balls contact each other closely.

Check that the steering stem rotates freely without vertical play.

Install the steering stem lock nut and tighten it while holding the top cone race. 

**Torque**: 6.0 ~ 8.0kgf-m

Install the front wheel. (⇨ 12-7)
Install the steering handlebar. (⇨ 12-3)
Install the speedometer cable. (⇨ 12-7)

[Special]

Long Socket Wrench, 32mm 8Angle
SERVICE INFORMATION

GENERAL INSTRUCTIONS

• During servicing, keep oil or grease off the brake drum and brake linings.

Special Tool
Cushion Assemble & Disassemble Tool

TROUBLESHOOTING

Rear wheel wobbling
- Bent rim
- Faulty tire
- Axle not tightened properly

Poor brake performance
- Brake not adjusted properly
- Worn brake linings
- Worn brake shoes at cam contacting area

Soft rear shock absorber
- Weak shock absorber spring
- Faulty damper
- Worn brake cam
- Worn brake drum
13. REAR WHEEL/REAR BRAKE/REAR SUSPENSION

REAR WHEEL

REMOVAL
Remove the exhaust muffler. (⇒2-5)
Remove the rear axle nut to remove the rear wheel.

INSPECTION
Measure the rear wheel rim runout.
Service Limits:
Radial: 2.0mm replace if over
Axial: 2.0mm replace if over

Inspect the rear brake drum.
Measure the rear brake drum I.D.
Service Limits: 111mm replace if over

INSTALLATION
Install the rear wheel in the reverse order of removal.
Tighten the rear axle nut.
Torque: 11.0-13.0kg-m
Install the exhaust muffler.
Torque:
Exhaust muffler joint lock nut: 1.0~1.4kgf-m
Exhaust muffler lock bolt: 3.0~3.6kgf-m

* First install and tighten the exhaust muffler joint lock nuts and then the exhaust muffler lock bolts.
13. REAR WHEEL/REAR BRAKE/REAR SUSPENSION

REAR BRAKE

BRAKE LINING INSPECTION
Measure the brake lining thickness.
Service Limit: 2.0mm replace if below

* Keep oil or grease off the brake linings.

REAR BRAKE DISASSEMBLY
Remove the rear brake adjusting nut and disconnect the rear brake cable.
Remove the rear brake shoes.

Remove the brake arm bolt to remove the brake arm, wear indicator plate and felt seal.
Remove the brake cam.

REAR BRAKE ASSEMBLY
Apply grease to the anchor pin.
Apply grease to the brake cam and install it.
Install the brake shoes.
13. REAR WHEEL/REAR BRAKE/REAR SUSPENSION

Apply a small amount of engine oil to the felt seal and install it to the brake cam. Install the wear indicator plate and brake arm.

* Align the wide groove on the wear indicator plate with the wide tooth of the brake cam.

Install and tighten the brake arm bolt.

* Align the scribed line on the brake arm with the punch mark on the brake cam.

Install the brake arm return spring. Install the brake arm pin. Connect the brake cable and install the adjusting nut. Install the rear wheel. (⇒13-2) Adjust the rear brake lever free play. (⇒3-8)

REAR SHOCK ABSORBER REMOVAL
Remove the frame body cover. (⇒2-3) Remove the air cleaner case. (⇒5-19)

Remove the rear shock absorber upper and lower mount bolts. Remove the rear shock absorber.

DISASSEMBLY
Install the rear shock absorber compressor as the figure shown.

* Install the rear shock absorber lower joint into the rear shock absorber compressor.

Compress the rear shock absorber spring.

[Special] Cushion Assemble & Disassemble Tool
Loosen the lower joint lock nut.
Remove the lower joint.
Remove the lock nut, rubber and damper.

**INSPECTION**
Inspect the damper rod for bending or damage.
Inspect the damper for oil leaks.
Inspect the damper rubber for deterioration or damage.

Measure the rear shock absorber spring free length.
**Service Limit**: 198mm replace if over

**ASSEMBLY**
Assemble the rear shock absorbers in the reverse order of disassembly.

- Install the shock absorber spring with loosely wound coils facing down.
- Apply locking agent to the lock nut threads and tighten the lock nut.
13. REAR WHEEL/REAR BRAKE/REAR SUSPENSION

INSTALLATION
Install the rear shock absorber.
Install the rear shock absorber upper mount bolt and then the lower mount bolt.
Tighten the bolts.
**Torque:**
Upper Mount Bolt: 3.5~4.5kgf-m
Lower Mount Bolt: 2.4~3.0kgf-m
Install the air cleaner case. (⇒ 5-15)
Install the frame body cover. (⇒ 2-3)
SERVICE INFORMATION

GENERAL INSTRUCTIONS

The battery electrolyte (sulfuric acid) is poisonous and may seriously damage the skin and eyes. Avoid contact with skin, eyes, or clothing. In case of contact, flush with water and get prompt medical attention.

- The battery can be charged and discharged repeatedly. If a discharged battery is not used for a long time, its service life will be shortened. Generally, the capacity of a battery will decrease after it is used for 2~3 years. A capacity-decreased battery will resume its voltage after it is recharged but its voltage decreases suddenly and then increases when a load is added.
- When a battery is overcharged, some symptoms can be found. If there is a short circuit inside the battery, no voltage is produced on the battery terminals. If the rectifier won’t operate, the voltage will become too high and shorten the battery service life.
- If a battery is not used for a long time, it will discharge by itself and should be recharged every 3 months.
- A new battery filled with electrolyte will generate voltage within a certain time and it should be recharged when the capacity is insufficient. Recharging a new battery will prolong its service life.
- Inspect the charging system according to the sequence specified in the Troubleshooting.
- Do not disconnect and soon reconnect the power of any electrical equipment because the electronic parts in the regulator/rectifier will be damaged. Turn off the ignition switch before operation.
- It is not necessary to check the MF battery electrolyte or fill with distilled water.
- Check the load of the whole charging system.
- Do not quick charge the battery. Quick charging should only be done in an emergency.
- Remove the battery from the motorcycle for charging.
- When replacing the battery, do not use a traditional battery.
- When charging, check the voltage with an voltmeter.

TORQUE VALUES

- Pulser coil bolt: 0.45~0.6kgf-m
- Stator bolt: 0.8~1.2kgf-m
- Flywheel nut: 3.5~4.5kgf-m
- Cooling fan bolt: 0.8~1.2kgf-m

SPECIAL TOOLS

- Universal holder
- Flywheel puller

TESTING INSTRUMENTS

- Kowa electric tester
- Sanwa electric tester

TROUBLESHOOTING

**No power**
- Dead battery
- Disconnected battery cable
- Fuse burned out
- Faulty ignition switch

**Intermittent power**
- Loose battery cable connection
- Loose charging system connection
- Loose connection or short circuit in lighting system

**Low power**
- Weak battery
- Loose battery connection
- Charging system failure
- Faulty regulator/rectifier

**Charging system failure**
- Loose, broken or shorted wire or connector
- Faulty regulator/rectifier
- Faulty A.C. generator
14. BATTERY/CHARGING SYSTEM/
A.C. GENERATOR

**BATTERY**

**REMOVAL**
Remove the battery cover screws on the floor board.
Open the battery cover and remove the battery by removing the bolt and band.
First disconnect the battery negative (-) cable and then the positive (+) cable.

> When disconnecting the battery positive (+) cable, do not touch the frame with tool; otherwise it will cause short circuit and sparks to fire the fuel.

The installation sequence is the reverse of removal.

> First connect the positive (+) cable and the negative (-) cable to avoid short circuit.

**BATTERY VOLTAGE (OPEN CIRCUIT VOLTAGE) INSPECTION**
Remove the floor board.
Open the battery cover and disconnect the battery cables.
Measure the voltage between the battery terminals.
Fully charged : 13.1V
Undercharged : 12.3V max.

* Battery charging inspection must be performed with a voltmeter.

**CHARGING**
Connect the charger positive (+) cable to the battery positive (+) terminal.
Connect the charger negative (-) cable to the battery negative (-) terminal.

> Keep flames and sparks away from a charging battery.
> Turn power ON/OFF at the charger, not at the battery terminals to prevent sparks near the battery to avoid explosion.
> Charge the battery according to the chart above.

* Quick charging should only be done in an emergency.
> Measure the voltage 30 minutes after the battery is charged.

Charging current: Standard : 0.4A
Quick : 4A
Charging time : Standard : 5~10 hours
Quick : 30 minutes
After charging: Open circuit voltage: 12.8V min.
Note: The battery temperature should not exceed 45°C during charging.
14. BATTERY/CHARGING SYSTEM
A.C. GENERATOR

CHARGING SYSTEM

SHORT CIRCUIT TEST
Disconnect the ground wire from the battery and connect an ammeter across the battery negative (-) terminal and the ground wire. Turn the ignition switch OFF and check for short circuit.

* Connect the electric tester positive (+) terminal to ground wire and the tester negative (-) terminal to the battery negative (-) terminal.

If any abnormality is found, check the ignition switch and wire harness for short circuit.

CURRENT TEST
This inspection must be performed with an electric tester when the battery is fully charged.
Warm up the engine for inspection.
Connect the electric tester across the battery terminals. Disconnect the fuse and connect an ammeter between the fuse terminals.
Attach a tachometer to the engine.
Start the engine and gradually increase the engine speed to measure the limit voltage and current.

Limit Voltage/Current: 14 ~ 15V/0.5A max. (5000rpm max.)

If the limit voltage is not within the specified range, check the regulator/rectifier. (⇒14-5)

LIGHTING SYSTEM LIMIT VOLTAGE INSPECTION
Remove the handlebar front cover. (⇒2-2)

* Measure the voltage with the electric tester in the AC range.

Limit Voltage: 12 ~ 14V (5000rpm max.)
If the limit voltage is not within the specified range, check the regulator/rectifier. (⇒14-5)

* Perform this test with a fully charged battery.
REGULATOR/RECTIFIER

MAIN HARNESS CIRCUIT INSPECTION
Remove the front covers. (☞2-2)
Remove the regulator/rectifier 4P coupler and check for continuity between the wire harness terminals according to the following :

<table>
<thead>
<tr>
<th>Item (Wire Color)</th>
<th>Judgment</th>
</tr>
</thead>
<tbody>
<tr>
<td>Between battery (red)</td>
<td>Battery has voltage</td>

<tr>
<td>ground</td>
<td></td>
</tr>
</tbody>
</table>

REGULATOR/RECTIFIER INSPECTION
If the main harness terminals are normal, check the regulator/rectifier coupler for loose connection and measure the resistances between the regulator/rectifier terminals.

* Do not touch the tester probes with your finger because human body has resistance.
* Use the following specified testers for accurate testing. Use of an improper tester in an improper range may give false readings.
  – Kowa Electric Tester
  – Sanwa Electric Tester
  – Kowa Electric Tester TH-5H
* Proper range for testing:
  – Use XKΩ range for Sanwa Tester
  – Use X100Ω range for Kowa Tester
* If the dry battery in the tester is weak, the readings will be incorrect. In this case, check the dry battery.
* The Kowa tester readings are 100 times the actual values. Be careful during testing.

Replace the regulator/rectifier if the readings are not within the specifications in the table.
A.C. GENERATOR CHARGING COIL
* The inspection of A.C. generator charging coil can be made with the engine installed.

INSPECTION
Disconnect the A.C. generator 2P connector. Measure the resistance between the A.C. generator white wire and engine ground with an electric tester.
Standard: 0.2 ~ 1.2Ω (at 20°C)
Replace the A.C. generator charging coil if the reading is not within the specifications.

A.C. GENERATOR LIGHTING COIL
* The inspection of A.C. generator lighting coil can be made with the engine installed.

INSPECTION
Disconnect the A.C. generator 2P connector. Measure the resistance between the A.C. generator yellow wire and engine ground with an electric tester.
Standard: 0.1 ~ 1.0Ω (20°C)
Replace the A.C. generator lighting coil if the reading is not within the specifications.

RESISTOR INSPECTION
Remove the front covers. (⇒2-2)
Measure the resistance between the resistor lead and engine ground.
Resistances: 5W12Ω: 11 ~ 13Ω
30W7.5Ω: 6 ~ 8Ω

A.C. GENERATOR REMOVAL
Remove the right side cover. (⇒2-4)
Remove the four bolts attaching the cooling fan cover to remove the fan cover.
14. BATTERY/CHARGING SYSTEM/
A.C. GENERATOR

Remove the cooling fan by removing the four cooling fan attaching bolts.

Hold the flywheel with an universal holder. Remove the flywheel nut.

Remove the A.C. generator flywheel using the flywheel puller. Remove the woodruff key.

Remove the A.C. generator wire connector.
Remove the A.C. generator wire set plate.
Remove the pulser coil bolts.
Remove the A.C. generator wire rubber sleeve and pulser coil from the right crankcase.
Remove the two bolts and A.C. generator stator.

**A.C. GENERATOR INSTALLATION**

Install the A.C. generator stator and pulser coil onto the right crankcase.
Tighten the stator and pulser coil bolts.
**Torques: Pulser Coil**: 0.45–0.6kgf-m
**Stator**: 0.8–1.2kgf-m

Install the A.C. generator wire rubber sleeve and A.C. generator wire set plate.
Connect the A.C. generator wire connector.

Clean the taper hole in the flywheel off any burrs and dirt.
Install the woodruff key in the crankshaft keyway.

Install the flywheel onto the crankshaft with the flywheel hole aligned with the crankshaft woodruff key.

* The inside of the flywheel is magnetic. Make sure that there is no bolt or nut before installation.

Hold the flywheel with the universal holder and tighten the flywheel nut.
**Torque:** 3.5~4.5kgf-m

**Special**
Universal Holder
Install the cooling fan.
**Torque:** 0.8~1.2kgf-m
Install the fan cover.
Install the right side cover. (⇒2-4)
15. IGNITION SYSTEM

SERVICE INFORMATION

GENERAL INSTRUCTIONS

• Check the ignition system according to the sequence specified in the Troubleshooting. (🔄15-2)
• The ignition system adopts CDI unit and the ignition timing cannot be adjusted.
• If the timing is incorrect, inspect the CDI unit and A.C. generator and replace any faulty parts. Inspect the CDI unit with a CDI tester.
• Loose connector and poor wire connection are the main causes of faulty ignition system. Check each connector before operation.
• Use of spark plug with improper heat range is the main cause of poor engine performance.
• The inspections in this section are focused on maximum voltage. The inspection of ignition coil resistance is also described in this section.
• Inspect the ignition switch according to the continuity table specified in page 17-3.
• Inspect the spark plug referring to Section 3.
• Remove the A.C. generator and pulser coil referring to Section 14.

TESTING INSTRUMENT

Kowa Electric Tester
or commercially available electric tester with resistance over 10MΩ/CDV
15. IGNITION SYSTEM

TROUBLESHOOTING

High voltage too low
- Weak battery or low engine speed
- Loose ignition system connection
- Faulty ignition coil
- Faulty CDI unit
- Faulty pulser coil

No or intermittent high voltage
- Faulty ignition coil
- Weak battery
- Faulty charging system

Intermittent high voltage
- Faulty ignition switch
- Poorly connected CDI unit coupler
- Poorly connected or broken CDI ground wire
- Faulty pulser coil
- Loose high tension wire connection
- Faulty CDI unit

Normal high voltage but no spark at plug
- Faulty spark plug
- Faulty spark plug cap

No high voltage
- Faulty ignition switch
- Dead battery or faulty regulator/rectifier
- Faulty charging circuit
- Faulty ignition coil
- Faulty CDI unit
15. IGNITION SYSTEM

CDI UNIT INSPECTION

Remove the three battery cover screws. Disconnect the CDI coupler and remove the CDI unit. Measure the resistance between the terminals using the electric tester.

*  
- Due to the semiconductor in circuit, it is necessary to use a specified tester for accurate testing. Use of an improper tester in an improper range may give false readings.
- Use a Sanwa Electric Tester or Kowa Electric Tester.
- In this table, “Needle swings then returns” indicates that there is a charging current applied to a condenser. The needle will then remain at “∞” unless the condenser is discharged.

IGNITION COIL

REMOVAL
Remove the met-in box. (⇔2-3)
Remove the spark plug cap.
Disconnect the ignition coil wires and remove
the ignition coil bolt and ignition coil.

INSPECTION
CONTINUITY TEST

* The CDI unit is not adjustable. If the
timing is incorrect, inspect the CDI unit,
pulser coil and A.C. generator and
replace any faulty parts.

Measure the resistance between the ignition
coil primary coil terminals.
Resistance: 0.1 ~ 1.0Ω

Measure the secondary coil resistances with
and without the spark plug cap.
Resistances:
(with plug cap) : 7 ~ 12KΩ
(without plug cap) : 3 ~ 5KΩ

* Correctly operate the tester following the
manufacturer's instructions.
15. IGNITION SYSTEM

PULSER COIL INSPECTION

* This test is performed with the stator installed in the engine.

Remove the frame body cover. (×2-3)
Disconnect the A.C. generator connector.

Measure the pulser coil resistance between the blue/yellow and green wire terminals.
**Resistance:** $80 \sim 160 \Omega$
Refer to page 14-6 for the A.C. generator removal.

IGNITION TIMING INSPECTION

* The CDI unit is not adjustable. If the ignition timing is incorrect, inspect the CDI unit, pulser coil and A.C. generator and replace any faulty parts.

Remove the timing hole cap.

Warm up the engine and check the ignition timing with a timing light.
When the engine is running at the ignition timing is correct if the “F” mark aligns with the index mark within $\pm 2^\circ$.
**Ignition Timing:** BTDC28°/4000rpm

TROUBLESHOOTING

Starter motor won't turn
- Fuse burned out
- Weak battery
- Faulty ignition switch
- Faulty starter clutch
- Faulty front or rear stop switch
- Faulty starter relay
- Poorly connected, broken or shorted wire
- Faulty starter motor

Lack of power
- Weak battery
- Loose wire or connection
- Foreign matter stuck in starter motor or gear

Starter motor rotates but engine does not start
- Faulty starter clutch
- Starter motor rotates reversely
- Weak battery
STARTER MOTOR

REMOVAL

Before removing the starter motor, turn the ignition switch OFF and remove the battery ground. Then, turn on the ignition switch and push the starter button to see if the starter motor operates properly.

Remove the mrt-in box.
Remove the starter motor cable.
Remove the two starter motor mounting bolts and the motor.

Remove the waterproof rubber jacket and disconnect the starter motor cable connector.

DISASSEMBLY

Remove the two starter motor case screws, front cover, motor case and other parts.

INSPECTION

Inspect the removed parts for wear, damage or discoloration and replace if necessary.
Clean the commutator if there is metal powder between the segments.

Check for continuity between pairs of the commutator segments and there should be continuity.
Also, make a continuity check between individual commutator segments and the armature shaft. There should be no continuity.
16. STARTING SYSTEM

STARTER MOTOR CASE CONTINUITY CHECK
Check to confirm that there is no continuity between the starter motor wire terminal and the motor front cover. Also check for the continuity between the wire terminal and each brush and there should be continuity. Replace if necessary.

Measure the length of the brushes.
**Service Limit**: 8.5mm replace if below

Check for continuity between the brushes. If there is continuity, replace with new ones.

Check if the needle bearing in the front cover turns freely and has no excessive play. Replace if necessary. Check the dust seal for wear or damage.
16. STARTING SYSTEM

ASSEMBLY
Apply grease to the dust seal in the front cover.
Install the brushes onto the brush holders.
Apply a thin coat of grease to the two ends of the armature shaft.
Insert the commutator into the front cover.

* Be careful not to damage the brush and armature shaft mating surfaces.
* When installing the commutator, the armature shaft should not damage the dust seal lip.

Install a new O-ring to the front cover.
Install the starter motor case, aligning the tab on the motor case with the tab on the front cover.
Tighten the starter motor case screws.

* When assembling the front cover and motor case, slightly press down the armature shaft to assemble them.

STARTER RELAY INSPECTION
Remove the met-in box.
Remove the battery cover.
Remove the frame body cover. (☞2-2)
Turn the ignition switch ON and the starter relay is normal if you hear a click when the starter button is depressed.
If there is no click sound:
* Inspect the starter relay voltage
* Inspect the starter relay ground circuit
* Inspect the starter relay operation

STARTER RELAY VOLTAGE INSPECTION
Place the motorcycle on its main stand.
Measure the voltage between the starter relay connector green/yellow wire (-) and engine ground.
Turn the ignition switch ON and the battery voltage should be normal when the brake lever is fully applied.
If the battery has no voltage, inspect the stop switch continuity and cable.

* Turn to the DCV position for the voltage meter, then inspect the starter relay.
16. STARTING SYSTEM

STARTER RELAY TEST
Remove the battery cover.
Disconnect the 4P connector from the starter relay and remove the starter relay.

Connect the starter relay (D) terminal to the 12V battery positive (+) terminal and the relay (C) terminal to the battery negative (-) terminal. Check for continuity between the starter relay (A) and (B) terminals. The relay is normal if there is continuity.

STARTER MOTOR INSTALLATION
Apply engine oil to the starter motor O-ring and install the starter motor.
Tighten the two mounting bolts.
Connect the starter motor cable connector.
SERVICE INFORMATION

GENERAL INSTRUCTIONS

• An electric tester is needed to measure or test the electric equipment.
• Be sure to use fuses and bulbs of the same specifications to avoid damage of electrical equipment.
• After installation of each switch, a continuity check must be performed. A continuity check can usually be made without removing the part from the motorcycle.

TROUBLESHOOTING

Lights do not come on when ignition switch is “ON”

• Burned bulb
• Faulty switch
• Broken wire
• Fuse burned out
• Weak battery
• Poorly connected or shorted wire
• Faulty winker

Light dims

• Faulty ignition coil
• Wire or switch resistance too high
• Faulty regulator/rectifier

Fuel gauge pointer does not register correctly

• Disconnected wire or connector
• Broken wire
• Faulty float
• Faulty fuel unit
• Faulty instrument

Fuel gauge pointer fluctuates or swings

• Loose wire connection
• Faulty fuel unit
• Faulty instrument

Headlight does not change when dimmer switch is turn to Hi or Lo

• Faulty or burned bulb
• Faulty dimmer switch
FUEL UNIT

* No Smoking!

REMOVAL
Remove the met-in box. (☞ 2-3)
Remove the frame right side cover. (☞ 2-4)
Disconnect the fuel unit wire connector.
Turn the fuel unit retainer counterclockwise to remove it.

* Do not damage the fuel unit wire.

Remove the fuel unit.

* Be careful not to bend or damage the fuel unit float arm.

INSTALLATION
The installation sequence is the reverse of removal.

* Align the groove on the fuel unit with the tab on the fuel tank.
* Align the arrow on the retainer with the arrow on the fuel tank.
* Turn the retainer clockwise to secure it.

INSPECTION
Remove the fuel unit.
Measure the resistance between the fuel unit wire terminals with the float at upper and lower positions.

IGNITION SWITCH REPLACEMENT

Remove the front covers. (⇒2-2)
Disconnect the ignition switch wire coupler.
Remove the two mounting bolts to remove the ignition switch decorative ring and holder.
Remove the two screws to remove the ignition switch from the ignition switch holder for replacement.
The installation sequence is the reverse of removal.
STOP SWITCH

INSPECTION
Remove the handlebar front cover. (⇒2-2)
Disconnect the front stop switch wire coupler.
Check for continuity between the wire terminals when the front brake lever is applied. The switch is normal if there is continuity.
Disconnect the rear stop switch wire coupler. Check for continuity between the wire terminals when the rear brake lever is applied. The switch is normal if there is continuity.

HORN

INSPECTION
Remove the front covers. (⇒2-2)
Disconnect the horn wire coupler.
The horn is normal if it sounds when a 12V battery is connected across the horn wire terminals.
REPLACEMENT
Disconnect the horn wire coupler.
Remove the two bolts attaching the horn.
Remove the horn.
The installation sequence is the reverse of removal.

INSTRUMENTS

Remove the handlebar front cover. (⇒2-2)
Remove the handlebar rear cover. (⇒2-2)
Disconnect the handlebar switch couplers.
Remove the three screws to remove the instruments.
Install a new horn in the reverse order of removal.
17. LIGHTS/INSTRUMENTS/SWITCHES

HEADLIGHT
REMOVAL
Remove the screw on the front of the front cover.
Remove the six screws on the back of the front cover.
Remove the front cover.
The installation sequence is the reverse of removal.

*Bulb Replacement
Remove the headlight bulb Coupler. (⇒2-2)
Remove the headlight replace with new bulbs.
The installation sequence is the reverse of removal.

TAILLIGHT/STOPLIGHT/REAR TURN SIGNAL LIGHT/LICENSE LIGHT
Remove the two screws attaching the rear protector molding.
Remove the rear protector molding and remove the two nuts attaching the rear light shell.
Remove the rear turn signal light bulb and replace with a new one.
The installation sequence is the reverse of removal.
18. EVAPORATIVE/EXHAUST EMISSION CONTROL SYSTEM

EXHAUST EMISSION CONTROL SYSTEM DIAGRAM
EXHAUST EMISSION CONTROL SYSTEM

The exhaust emission control system adopted in this model utilizes the reed valve to draw secondary air into the exhaust system for re-combustion by means of exhaust pulsation so as to minimize the exhaust emission.

FUNCTION

<table>
<thead>
<tr>
<th>Item</th>
<th>Purpose</th>
<th>Function</th>
</tr>
</thead>
<tbody>
<tr>
<td>Secondary Air Cleaner</td>
<td>Filter secondary air.</td>
<td>It filters the fresh air drawn for re-burning to prevent dirt or dust from affecting the operation of the air injection cut-off valve.</td>
</tr>
<tr>
<td>Air Injection Cut-off Valve</td>
<td>Prevent exhaust muffler noise and backfiring at sudden deceleration.</td>
<td>The air injection cut-off valve usually opens to lead air into the exhaust muffler in which air is re-burned to reduce CO. When the throttle valve closes suddenly, the air injection cut-off valve is actuated by vacuum to close and cut off secondary air in order to prevent exhaust muffler backfiring due to air in the exhaust system.</td>
</tr>
<tr>
<td>Reed Valve</td>
<td>Control the secondary air inlet to reduce CO.</td>
<td>When the motorcycle speed is less than 50km per hour, the reed valve operates to draw secondary air into the exhaust system for re-combustion.</td>
</tr>
</tbody>
</table>

SERVICE INFORMATION

GENERAL INSTRUCTIONS
• During operation, be careful to avoid scalding caused by the exhaust muffler.
• Note the locations of tubes for proper installation.
• Replace any damaged tube with a new one.
• Make sure to tighten the connector of each tube securely

TOOLS
• Vacuum pump —

SPECIFICATIONS
• Air injection cut-off valve actuating pressure — 250mm/Hg — 30 liter/min.
• Reed valve stopper clearance — 6.6mm

TROUBLESHOOTING

High CO at idle speed
• Damaged or clogged reed valve
• Damaged or clogged air injection cut-off valve
• Clogged air cleaner

Exhaust muffler noise
• Faulty air injection cut-off valve
• Broken vacuum tube
• Faulty reed valve

Backfiring at sudden deceleration
• Damaged reed valve (malfunction)
• Faulty air injection cut-off valve (unable to close)
• Carburetor incorrectly adjusted
• Faulty air cut-off valve
• Leaking vacuum tube

**Remarks**
- Inspect, A: Adjust, C: Clean, R: Replace, T: Tighten
- During riding or inspection, if any part is found to be cleaned, adjusted or replaced, do it directly and take a record if the exhaust emission control system is not seriously affected. It must be reported and approved if the exhaust emission control system is seriously affected.

#### (2) IRREGULAR MAINTENANCE:

<table>
<thead>
<tr>
<th>Item</th>
<th>Contents</th>
</tr>
</thead>
<tbody>
<tr>
<td>Ignition system</td>
<td>Inspect and repair when obvious symptoms of ignition failure, engine overheating and stalling are found frequently.</td>
</tr>
<tr>
<td>Carbon deposit removal</td>
<td>Remove carbon deposits from the exhaust system, cylinder head and piston head when the engine horsepower decreases greatly during the service mileage of 10000~15000 km.</td>
</tr>
<tr>
<td>Transmission system</td>
<td>Perform CVT system maintenance and inspection when the engine performance decreases obviously.</td>
</tr>
<tr>
<td>Piston</td>
<td>Severe use in the first 1000 km may cause worn or seized cylinder, piston and piston rings. Clean or replace with new ones if necessary.</td>
</tr>
</tbody>
</table>
SECONDARY AIR CLEANER

REMOVAL
Remove the met-in box. (⇒2-3)
Remove the center cover. (⇒2-3)
Remove the rear seat and rear carrier. (⇒2-3)
Remove the frame body covers. (⇒2-4)
Remove the floor board. (⇒2-4)

Disconnect the secondary air cleaner connecting tube.
Remove the air cleaner attaching the air cleaner.

INSTALLATION
The installation sequence is the reverse of removal.

DISASSEMBLY
Remove the two secondary air cleaner
replace with new secondary air cleaner.

* The secondary air cleaner must be
assembled and installed properly to
avoid dust entering the air cleaner.
